Give the hardware manufacturers the ability to run sandboxes on their machines. Something like having a separate partition with Lightroom installed that only opens in developer mode to viewing files, and by selecting to do so. Only for X number of days.

Some may have the desire, like I mentioned, to be able to decrypt the photo file when returned. That's a security issue right there.

Basically I want a chip with a key that only I should be able to operate and who am I kidding, that device should be physical, and I could sell it. I have my own personal scanner and Photoshop only becomes slow if I try to open a large bracket of images from the machine. The snaps that I take around the house/garden, open very quickly which supports the assertion that they are not the bottleneck. Those images have not been altered in any way in a non-destructive fashion. I'm sure educational institutions around the world will be giving Photoshop Shock at least six solid hours of hands on learning over the next few months. The presentation at NAB 2013 demonstrated at least six times as much as the previous programs and it is an impressive overview of the new release. Clearly the 50th edition of Photoshop is targeted at advanced users and some schools will find it useful to add to their existing curriculum, but it certainly begs broader educational application too. My own understanding is that the most crucial thing is that it "makes sense" to the creator and that means that it offers a participatory design approach where you are encouraged to experiment, experiment again and then experiment even more. It's a process of change, with little chance of failure as long as you ensure that you test within the parameters of your work. It's interesting to watch that the more you push the tools the more they change, which must make it hard for those who have spent their time with a particular workflow and who could never imagine a workflow that is any different. For that reason, I'm particularly glad of the "school of thought". Hence, I haven't included any examples below, but after a bit of tweaking and experimentation I have included copies of the Pen tool and the Gradient tool to illustrate how closely this can be mapped onto a stylistic approach. You will see that the Gradient tool allows you to copy values from other Gradients or Colour Layers.

Now, you've used these tools in Photoshop to help you create a layered file along with a few other tools like the **Brush tool** and **Fill tool**. You've duplicated the shape layers you just created for the project in order to apply the same settings to other parts of the file. All of the new features and enhancements in this release were vetted first in the award-winning Adobe Camera Raw, Photoshop,Lightroom, Illustrator, and mobile app development teams and the Photoshop Camera team worked closely with these teams throughout development. You'll still be working on the original PSD where you saved it, but in Photoshop, you can manipulate it in many different ways depending on the tool you click. An image is created by a series of layers. You can create new layers by clicking on the New Layer button on the top left of the workspace. "At Adobe we know that people care about accessibility and usability, and we also know our customers and users want to work in a less intimidating, more collaborative way than has been available before," said Maggie Brim, Chief Marketing Officer at Adobe. "Helping customers create and share the images they want, and collaborate on projects without leaving the Photoshop environment is core to the way we do business at Adobe. Collaborating on files and projects in the browser is a natural extension of the way the digital creative community now works. Designers and non-designers now share identities and collaborate on graphics, so we designed Share for Review to be an extension of what people already know and use. We're trying a new method to get people familiar with new editing tools with practical assignments." Share for Review is a feature in Photoshop CC that is available via the side bar in the Photoshop environment. With Share for Review, Photoshop users can conveniently collaborate on projects without leaving the Photoshop environment. Share for Review enables users to see layers, masks, and blend modes together, and easily insert or replace elements in other layers in real time. Additionally, they can paint with strokes to suggest image adjustments—ideally, the changes should be made within the Photoshop environment instead of the web browser. Adobe also just released a new Web Make tool in

Photoshop CC. Paired with Share for Review the team can work on files directly in the web browser, without leaving Photoshop, and upload or save finished files to the cloud.
