I fired up Lightroom 6 Beta, and created a set of 3 new Loaded Swatches from my online feed. Lightroom's new feature to populate color swatches based on online feed or library is particularly helpful. Load Swatches in Adobe Lightroom. How Adobe's New Photoshop Affects My Work. Using the new, simplified selections—no more “Select everything with this tool,” or “Define new selection here,” etc. I could get the intended, clean selection. I wanted to adjust the details. I worked on the selected image in Quick Fix, but before moving to the next steps, I decided to go back to my original image and make changes from there. As the content of the original image begins to match the one I want to save, I thought the experience will be of optimal quality. Nice review! I might use it to replace CS4

Single window mode should be the default and the new PSD file EXIF should be indicator.

I don't like the new fullscreen button with the grey circle. Instead it should be the same with the method used for brightness and volume (but with the same size of the black circle) and with a similar face shape a button with which you can increase/decrease the buttons size.

Color spaces are interesting. Specially Delta ECT. I can see a strong future for this kind of software, but not for those of us (like me) who want to be great realistic artists (to be honest I prefer photorealistic)

Even if it is not the best for it, ACR and other software are looking like a weak failure (they just copy functions from PS like smartcrop, filters and so on). In reality, the final work is done in PS and not on their software. Any student who learned a graphic program should know that. And finally, they often add cropping and key frames features that people find useless.

When editing images, you want to avoid having to load each file into the program. Simply open a folder in the program and start working on that folder of images. By opening the photos directly within the program rather than having to put the images into a new folder, you can save time. However, you can set any folder to sync with incoming images into a catalog. When in the program, you can click on your desktop and then go to the sync menu and choose an option of importing photos into the program. This will make it easy for you to open a folder and start working on it. Don't spend hours trying to get your images in the folder, etc. Once you've imported all the images into the folder, you can select all the images you want to work on and then export the folder to your desktop. If you do have a machine that's a little older, remember that even though Photoshop is a fairly new software, it does have some limitations on OS X Lion and Mac operating systems. Photoshop allows you to open multiple files at once, which can be useful on older computers since processing is done in real time without needing to save the images as you work through them. If you're planning to work with older hardware in the future, take this into account. The best way to prioritize is to set up an image workflow that is meaningful to you and to your personal style. Efficient workflow is the key to successful editing. For example: If you're just learning the software, you may want to compress your RAW images to very high levels but that may not be right for your pictures. This is something that any good graphic designer knows. Putting the emphasis on extremely precise editing of individual layers is one way, but it can be too time-consuming for the projects you do. There are ways to save time in your workflow. For example, if you're using a plug-in like Photomatix or ColorEfex Pro2, you can make massive adjustments to your raw files, like exposure, color, and contrast, which can save a lot of time.
