Adding text is easy. You can click on any text box, choose the font you want, and, if you have your type size handy, type in the desired size. You can create particularly nice type effects with this tool. The text layer is stacked under the image layer, so you can add annotations “underneath” the piece you are working on. Best of all, you can move the text under the photo with an easy drag-to-move tool. You can also rotate and crop the text (use the settings on the right side of the screen) in addition to moving it. Crop under the “Crop” tab. Text can be a helpful tool for advertising. To be successful in this area, try to keep the text to a minimum; otherwise, you may have very little space to work with. After all that text, the retouching tools seem uncharacteristically erratic. There is an Area Crop tool for everything! Browsing through some of the presets you can find there, however, gives you a good sample of the range of features provided by this very capable tool. In addition to a despeckle and healing tool, the tool features a combo of blur, sharpen, and clone techniques. I do like the low-light-optimized sharpening, but the built-in despeckling tool leaves much to be desired. Perhaps it would help to have a light-room that could detect which despeckling tools are in use. To that end, when I tried to edit former Lightroom user Aperture’s Photoshop files in Lightroom, it failed to recognize the despeckling tools and successfully imported what I edited. It also seems overly aggressive at times and tends to smooth off details, or it may adjust an image to make a highlight perfectly uniform. This happens automatically on some masks and does not affect other areas. The tool is not as aggressive as I would like, but it is certainly useful in its more gentle modes, such as targeted sharpening that allows you to make tiny changes slowly and precisely. It also works well for removing unwanted shadows.
